FOR IMMEDIATE RELEASE

GRANDSTREAM RELEASES FIRMWARE ENHANCEMENT FOR HT50X SERIES ATA AND GXW40XX SERIES FXS GATEWAYS

Brookline, MA (July 2, 2008) – Grandstream Networks, a leading global manufacturer of high quality and cost-effective IP-PBXs, enterprise gateways, and IP voice and video endpoints for the worldwide VoIP market, today announced the release of new firmware that enhances the performance and security protection of several key products in Grandstream's robust product portfolio, the HT502/HT503 ATA and GXW4004/4008/4024 FXS gateways.

The new firmware enhancement, available for public download from Grandstream's website in mid-July, will include a number of advanced features such as security protection, performance improvement as well as bug fixes.

Specifically, the new firmware enhancement will allow the 24-port FXS gateway GXW4024 to support 24 simultaneous calls on all ports using any codec (such as G.711, G.726, G.723.1, G.729A/B, iLBC). This performance boost will allow service providers and enterprise users to confidently deploy the GXW4024 in any busy network and high call traffic situations.

Additionally, the new firmware enhancement will also support secure client certificates when using secure HTTPS provisioning. This advanced feature will ensure confidential device configuration and account information to be sent securely over the Internet between a CPE device and the service provider's provisioning system. This enhancement will be appealing to service providers who rely on strong security protection to remotely and securely provision and manage large quantity of deployed CPE devices over the public Internet.
