## OVERVIEW

This document describes basic configuration to interconnect UCM6XXX series and HT503. This is typically applied to the scenario where users would like to add a HT503 not only as a remote extension but also as an external PSTN trunk. It could be common that we prefer to grab a PSTN line in a remote location and use the carrier service on another remote office, in this case this guide will help you implement this configuration.

There are two ways to set up the UCM6XXX series IP PBX with the HT503.

- **Method 1:** Register the HT503 to the UCM6XXX directly.
- **Method 2:** Configure HT503 as a SIP peer trunk.

**Note:** UCM6XXX series include UCM6100 series (UCM6102, UCM6104, UCM6108 and UCM6116), UCM6200 series (UCM6202, UCM6204 and UCM6208) and UCM6510.

---

 **Warning:**

- When the UCM6XXX series is interconnected with other HT503, it is NOT recommended to turn on "Allow Guest Calls" under the UCM6XXX web GUI→**PBX**→**SIP Settings**→**General**. Turning on this option will allow unauthenticated calls coming through the UCM6XXX series. Please be aware of the security concerns when using this option.
- When using the IVR in UCM6XXX series, please be aware that if "Dial Trunk" option is turned on in IVR settings, the callers into the IVR will be able to dial outbound call using UCM6XXX's trunk. The IVR's permission level will be used when making outbound calls in this case. Please select proper permission level for the IVR to control the outbound calls allowed via "Dial Trunk".

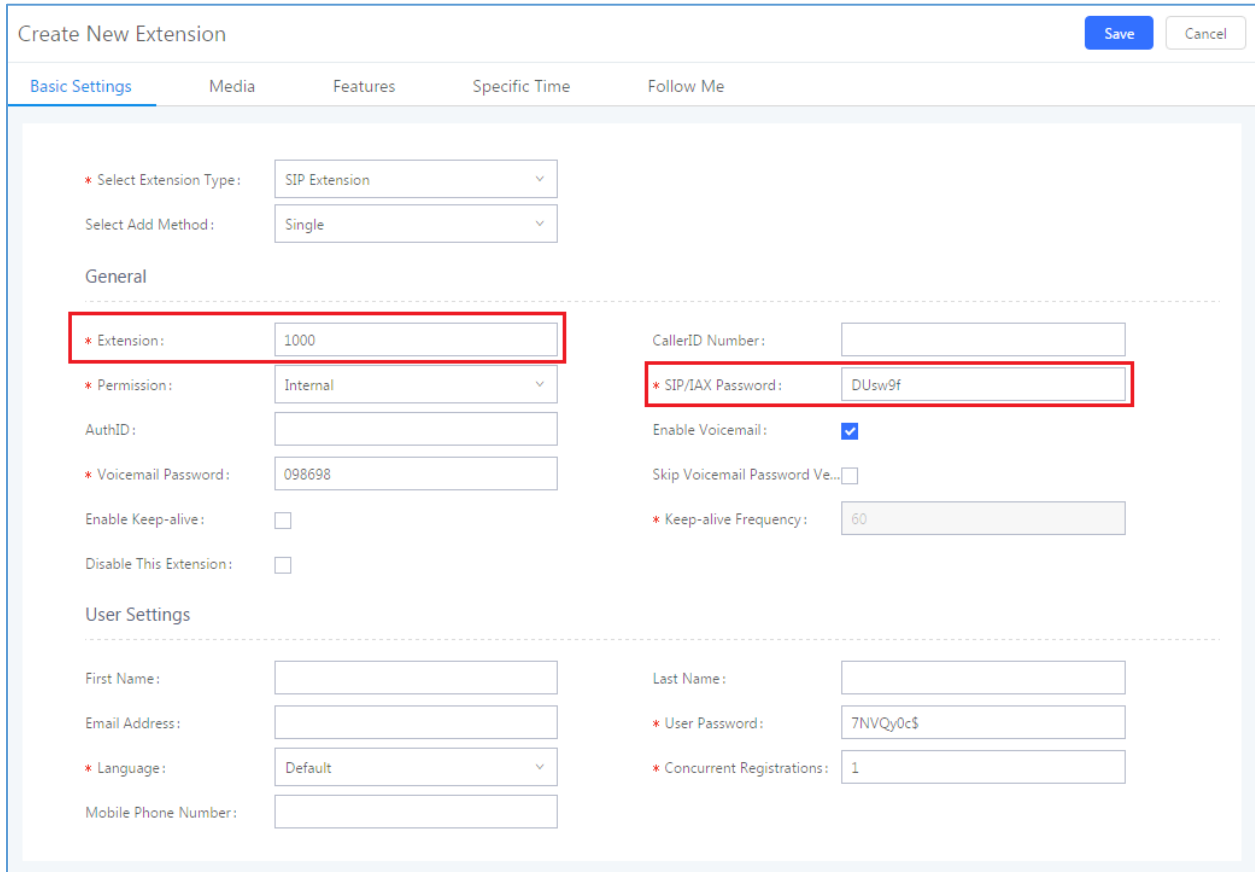

## METHOD 1: REGISTER HT503 TO UCM6XXX

### Create Extension on UCM6XXX

On the UCM6XXX web GUI, create two extensions under **Extension/Trunk→Extensions**. These two extensions are used for HT503 FXS and FXO registration.

The password for the extension will be randomly generated if not specified.

The screenshot displays the 'Create New Extension' web interface. The 'Basic Settings' tab is active. The form includes the following fields and options:

- Select Extension Type:** SIP Extension (dropdown)
- Select Add Method:** Single (dropdown)
- General Section:**
  - \* Extension:** 1000 (text input, highlighted with a red box)
  - \* Permission:** Internal (dropdown)
  - AuthID:** (text input)
  - \* Voicemail Password:** 098698 (text input)
  - Enable Keep-alive:**
  - Disable This Extension:**
  - CallerID Number:** (text input)
  - \* SIP/TAX Password:** DUsw9f (text input, highlighted with a red box)
  - Enable Voicemail:**
  - Skip Voicemail Password Ve...:**
  - \* Keep-alive Frequency:** 60 (text input)
- User Settings Section:**
  - First Name:** (text input)
  - Last Name:** (text input)
  - Email Address:** (text input)
  - \* User Password:** 7NVQy0c\$ (text input)
  - \* Language:** Default (dropdown)
  - \* Concurrent Registrations:** 1 (text input)
  - Mobile Phone Number:** (text input)

## Create IVR on UCM6XXX

On the UCM6XXX web GUI, create an IVR extension under **Call Features**→**IVR**. This is to receive the calls forwarded from the HT503.

In IVR settings, if "Dial Other Extensions" is enabled, the calls forwarded to the UCM6XXX IVR will be able to reach the internal extensions registered to the UCM6XXX. Also, you can assign the "Key Pressing Event" to different destinations.

## Configure FXS Port on HT503

1. Connect an analog phone to the HT503 FXS port.
2. On the HT503 web GUI, go to FXS Port setting page, configure to register the FXS port to the UCM6XXX extension 1000. Please refer to the highlighted settings in the following figure.

In this example, the UCM6XXX IP address is 192.168.5.250.

Grandstream Device Configuration	
STATUS	BASIC SETTINGS
<b>Account Active:</b> <input type="radio"/> No <input checked="" type="radio"/> Yes	
<b>Primary SIP Server:</b> 192.168.5.250 (e.g., sip.mycompany.com, or IP address)

<b>Outgoing Call without Registration:</b> <input type="radio"/> No <input checked="" type="radio"/> Yes	

Figure 4: Configure FXS Port on the HT503

## Configure FXO Port on HT503

1. Connect the PSTN line to the HT503 FXO port.
2. On the HT503 web GUI, go to FXO Port setting page, configure to register the FXO port to the UCM6XXX extension 1001. Please refer to the highlighted settings and other necessary settings in the following figures.

In this example, the UCM6XXX IP address is 192.168.5.250.

<b>Outgoing Call without Registration:</b>	<input checked="" type="radio"/> No <input type="radio"/> Yes	

**Figure 5: Configure FXO Port on the HT503 - Registration**

Since we are going to use IVR when the call is forwarded to the UCM6XXX, the UCM6XXX will need to be able to detect the DTMF digits. Configure the HT503 FXO port DTMF settings as below as an initial setup.

<i>Preferred DTMF method:</i>	Priority 1:	<input style="width: 80%;" type="text" value="RFC2833"/>
<i>(in listed order)</i>	Priority 2:	<input style="width: 80%;" type="text" value="SIP INFO"/>
	Priority 3:	<input style="width: 80%;" type="text" value="In-audio"/>

**Figure 6: Configure FXO Port on the HT503 - DTMF Settings**

There are a few necessary changes to be made in FXO termination section and Channel Dialing section as well.

**FXO Termination**

*Enable Current Disconnect:*  No  Yes (Default Yes. If set to yes, enter threshold below)

*Current Disconnect Threshold (ms):*  (50-800 milliseconds. Default 100 milliseconds)

*Enable PSTN Disconnect Tone Detection:*  No  Yes (Default No)  
 (If set to yes, the following tone is used as the disconnect signal)

*PSTN Disconnect Tone:*   
 (Syntax: f1=freq@vol, f2=freq@vol, c=on1/off1-on2/off2-on3/off3;)  
 (Allowed Range: freq = 0 to 4000Hz; vol = -40 to -24dBm)  
 (Default: Busy Tone: f1=480@-32,f2=620@-32,c=500/500;)

*AC Termination Model*  Country-based  Impedance-based (Default Country-based )

*Country-based*

*Impedance-based*

*Number of Rings:*  (1-50. Default 4)  
 (Number of rings for a PSTN incoming call before FXO port answers to accept VoIP number)

*PSTN Ring Thru FXS:*  No  Yes (Default Yes)  
 (If set to yes, all incoming PSTN calls will ring the FXS port after the Ring Thru Delay)

*PSTN Ring Thru Delay (sec):*  (1-10 seconds. Default 4 seconds)

*PSTN Ring Timeout (sec):*  (2-10 seconds. Default 6 seconds)  
 (Used to detect PSTN hangup when FXO port is not answered)

**Figure 7: Configure FXO Port on the HT503 - FXO Termination**

- First, we should confirm which method the PSTN line is using.

If the PSTN line is using current disconnect (typical case in North America), then we should turn on "Enable Current Disconnect" and disable "Enable PSTN Disconnect Tone Detection".

The default "Current Disconnect Threshold" is 100ms, but if you start experiencing dropped calls then you should raise this value by 100ms intervals.

If the PSTN disconnects using the tones method, then turn on "Enable PSTN Disconnect Tone Detection" and turn off the "Enable Current Disconnect" option.

For PSTN tone detection, the tone disconnect method is widely used everywhere else in the world. The North American busy tone value is "f1=480@-32,f2=620@-32,c=500/500" but these tones vary from country to country. You may look up for the settings for your country at [www.3amsystems.com](http://www.3amsystems.com) or download the information from <http://www.itu.int/ITU-T/inr/forms/files/tones-0203.pdf>.

- Set "Number of Rings" option to 1. If you happen to experience caller ID issue, you may set it to 2 or 4.
- Set "PSTN Ring Thru FXS" to "No" if you prefer not to ring the FXS port on incoming PSTN calls after the Ring Thru Delay. In the sample setup, it's set to "Yes".

- Set "PSTN Ring Thru Delay" option to 1. If you happen to experience caller ID issue, you may set it to 2.
- Set the "Stage Method (1/2)" to 2 for 2-stage dialing.

<i>Stage Method (1/2):</i> <input type="text" value="2"/> (Default 2 - 2 stage dialing)
---

Figure 8: Configure FXO Port on the HT503 - Channel Dialing

## Configure Unconditional Call Forward on HT503

On the HT503 web GUI, go to Basic setting page, configure "Unconditional Call Forward to VOIP" to the IVR extension on the UCM6XXX. In this example, the UCM6XXX IP address is 192.168.5.250.

	User ID	Sip Server	Sip Destination Port
<i>Unconditional Call Forward to VOIP:</i>	<input type="text" value="7000"/>	@ <input type="text" value="192.168.5.250"/>	: <input type="text" value="5060"/>

Figure 9: HT503 Basic Settings

## How to Dial

Once the HT503 and the UCM6XXX are set up as above, the inbound call and the outbound call will be working as described below.

- **Outbound call**  
 The extension registered to the UCM6XXX can dial the HT503's FXO extension number (1001 in this example). After you get the second dial tone, you can then dial a PSTN network number. Basically, the outbound call is done in a 2-stage manner.
- **Inbound call**  
 The user from outside network can dial into the PSTN line's number (connected to HT503). And then he/she will reach the IVR of the UCM6XXX. The IVR on UCM6XXX would allow the user to further enter extension number or key pressing digit to reach the desired destination.

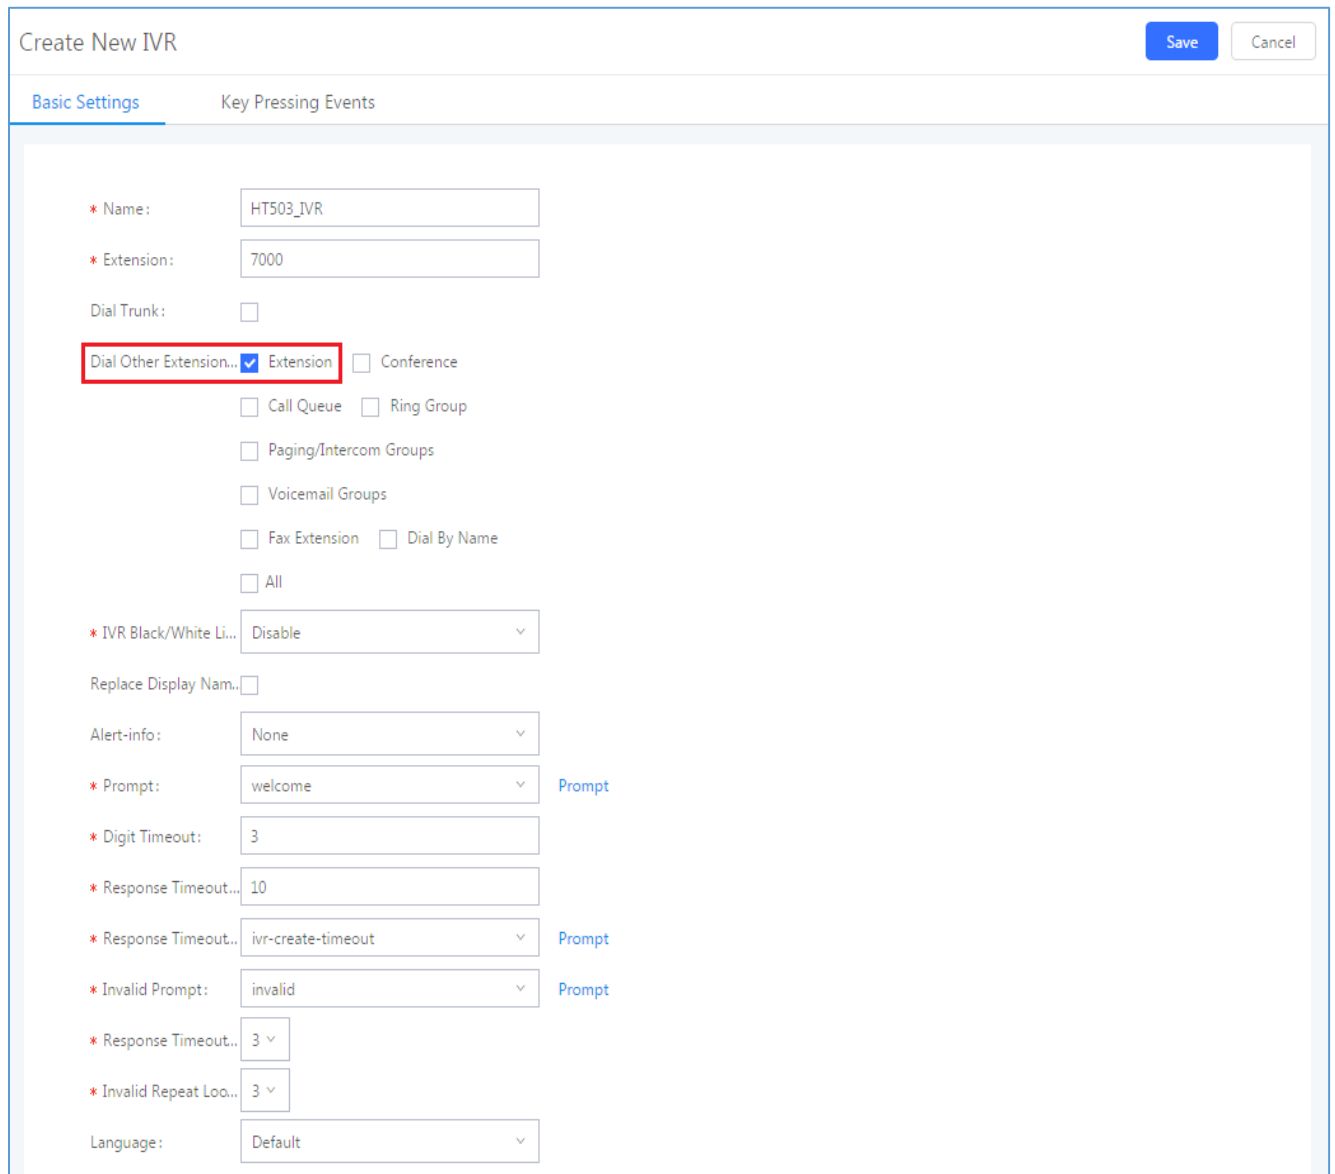

## METHOD 2: CONNECT UCM6XXX TO HT503 USING PEER SIP TRUNK

### Create IVR on UCM6XXX

On the UCM6XXX web GUI, create an IVR extension under **Call Features**→**IVR**.

In IVR settings, if "Dial Other Extensions" is enabled, the calls dialing into the UCM6XXX IVR will be able to reach the internal extensions registered to the UCM6XXX. Also, you can assign the "Key Pressing Event" to different destinations.

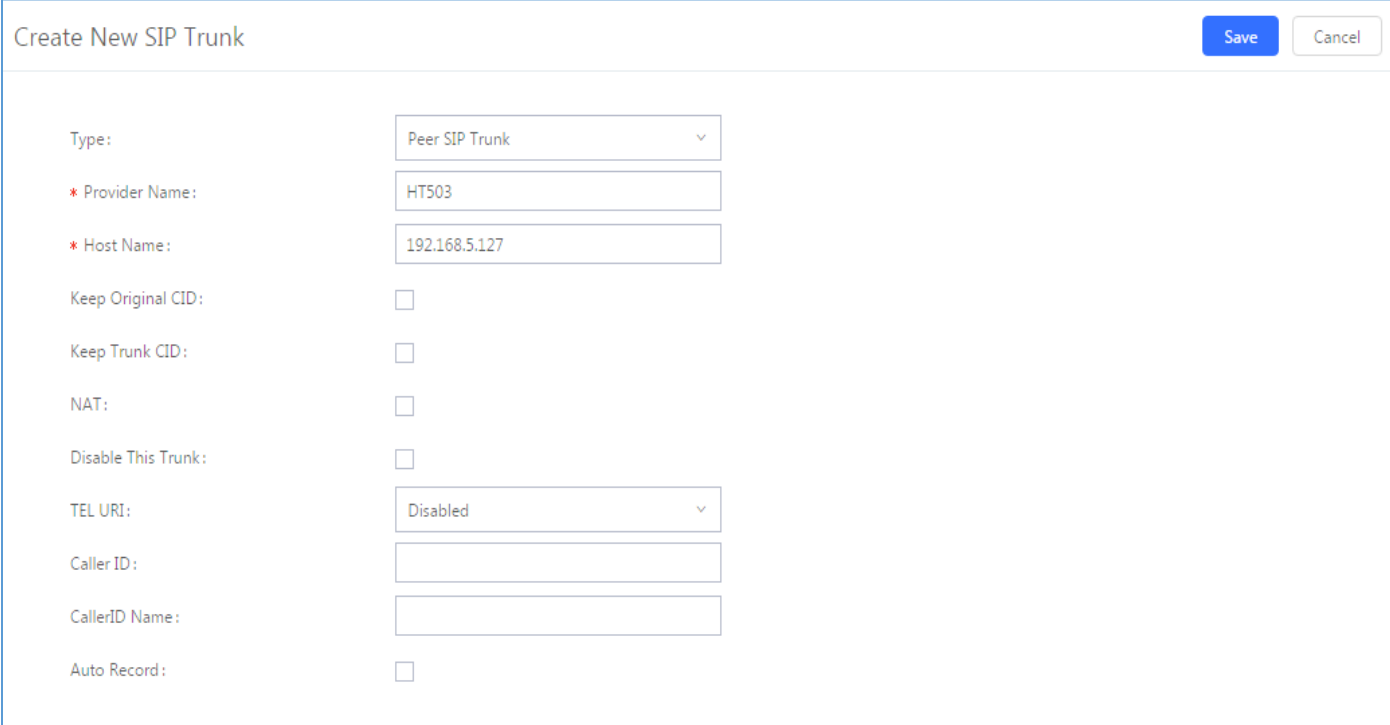

The screenshot shows the 'Create New IVR' configuration page. The 'Basic Settings' tab is active. The 'Name' field is 'HT503\_IVR' and the 'Extension' field is '7000'. The 'Dial Trunk' checkbox is unchecked. The 'Dial Other Extension...' checkbox is checked and highlighted with a red box. Other options include 'Extension', 'Conference', 'Call Queue', 'Ring Group', 'Paging/Intercom Groups', 'Voicemail Groups', 'Fax Extension', 'Dial By Name', and 'All'. The 'IVR Black/White Li...' dropdown is set to 'Disable'. The 'Replace Display Nam...' checkbox is unchecked. The 'Alert-info' dropdown is set to 'None'. The 'Prompt' dropdown is set to 'welcome'. The 'Digit Timeout' is set to '3'. The 'Response Timeout...' is set to '10'. The 'Response Timeout...' dropdown is set to 'ivr-create-timeout'. The 'Invalid Prompt' dropdown is set to 'invalid'. The 'Response Timeout...' dropdown is set to '3'. The 'Invalid Repeat Loo...' dropdown is set to '3'. The 'Language' dropdown is set to 'Default'. There are 'Save' and 'Cancel' buttons at the top right.

Figure 10: Create IVR 7000 on the UCM6XXX

## Create Peer SIP Trunk on UCM6XXX

On the UCM6XXX web GUI, create a peer SIP trunk under **Extension/Trunk→VoIP Trunks**. In this example, the HT503 IP address is 192.168.5.127.

The screenshot shows the 'Create New SIP Trunk' form with the following fields and values:

- Type: Peer SIP Trunk (dropdown)
- \* Provider Name: HT503
- \* Host Name: 192.168.5.127
- Keep Original CID:
- Keep Trunk CID:
- NAT:
- Disable This Trunk:
- TEL URI: Disabled (dropdown)
- Caller ID: (empty text box)
- CallerID Name: (empty text box)
- Auto Record:

Figure 11: Create Peer SIP Trunk on the UCM6XXX

## Configure Outbound Rule on UCM6XXX

On the UCM6XXX web GUI, go to **Extension/Trunk→Outbound Routes** to create a new outbound rule. This would allow the extension on the UCM6XXX to reach numbers in PSTN network via the peer SIP trunk we just configured.

**Figure 12: Configure Outbound Rule on the UCM6XXX**

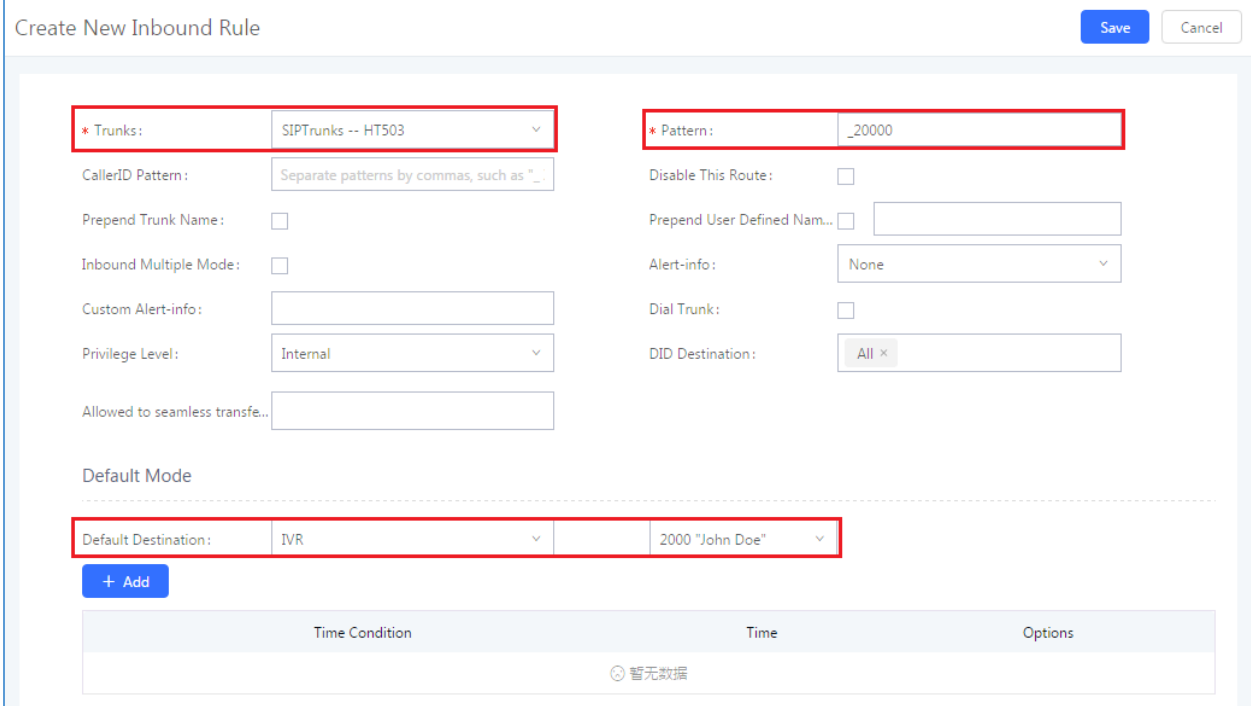

In this example "91XXXXXXXXXX", 9 is the first dialing digit and it will be stripped off when the call goes out.

### Configure Inbound Rule on UCM6XXX

On the UCM6XXX web GUI, go to **Extension/Trunk→Inbound Routes** to create a new inbound rule.

In this example, we create the DID as **2000**, which will be used in the HT503 call forward setting.

**Figure 13: Configure Inbound Rule on the UCM6XXX**

The default destination is configured to IVR.

## Configure FXO Port on HT503

1. Connect the PSTN line to the HT503 FXO port.
2. On the HT503 web GUI, go to FXO Port setting page, configure the FXO port to send signaling SIP messages to the UCM6XX's IP address. Please refer to the highlighted settings and other necessary settings in the following figures.

You can set anything you want on the SIP user ID, authentication ID and username. We choose 1001 on our example.

In this example, the UCM6XXX IP address is 192.168.5.250.

Figure 14: Configure FXO Port on the HT503 - Registration

Since we are going to use IVR when the call is forwarded to the UCM6XXX, the UCM6XXX will need to be able to detect the DTMF digits. Configure the HT503 FXO port DTMF settings as below for an initial setup.

<b>Preferred DTMF method:</b>	<b>Priority 1:</b>	<input style="width: 90%;" type="text" value="RFC2833"/>
<i>(in listed order)</i>	<b>Priority 2:</b>	<input style="width: 90%;" type="text" value="SIP INFO"/>
	<b>Priority 3:</b>	<input style="width: 90%;" type="text" value="In-audio"/>

Figure 15: Configure FXO Port on the HT503 - DTMF Settings

There are a few necessary changes to be made in FXO termination section and Channel Dialing section.

**FXO Termination**

**Enable Current Disconnect:**  No  Yes (Default Yes. If set to yes, enter threshold below)

**Current Disconnect Threshold (ms):**  (50-800 milliseconds. Default 100 milliseconds)

**Enable PSTN Disconnect Tone Detection:**  No  Yes (Default No)

(If set to yes, the following tone is used as the disconnect signal)

**PSTN Disconnect Tone:**

(Syntax: f1=freq@vol, f2=freq@vol, c=on1/off1-on2/off2-on3/off3;)  
 (Allowed Range: freq = 0 to 4000Hz; vol = -40 to -24dBm)  
 (Default: Busy Tone: f1=480@-32,f2=620@-32,c=500/500;)

**AC Termination Model**  Country-based  Impedance-based (Default Country-based)

**Country-based**

**Impedance-based**

**Number of Rings:**  (1-50. Default 4)  
 (Number of rings for a PSTN incoming call before FXO port answers to accept VoIP number)

**PSTN Ring Thru FXS:**  No  Yes (Default Yes)  
 (If set to yes, all incoming PSTN calls will ring the FXS port after the Ring Thru Delay)

**PSTN Ring Thru Delay (sec):**  (1-10 seconds. Default 4 seconds)

**PSTN Ring Timeout (sec):**  (2-10 seconds. Default 6 seconds)  
 (Used to detect PSTN hangup when FXO port is not answered)

**Figure 16: Configure FXO Port on the HT503: FXO Termination**

- First, we should confirm which method the PSTN line is using.

If the PSTN line is using current disconnect (typical case in North America), then we should turn on "Enable Current Disconnect" and disable "Enable PSTN Disconnect Tone Detection".

The default "Current Disconnect Threshold" is 100ms, but if you start experiencing dropped calls then you should raise this value by 100ms intervals.

If the PSTN disconnects using the tones method, then turn on "Enable PSTN Disconnect Tone Detection" and turn off the "Enable Current Disconnect" option.

For PSTN tone detection, the tone disconnect method is widely used everywhere else in the world. The North American busy tone value is "f1=480@-32,f2=620@-32,c=500/500" but these tones vary from country to country. You may look up for the settings for your country at [www.3amsystems.com](http://www.3amsystems.com) or download the information from <http://www.itu.int/ITU-T/inr/forms/files/tones-0203.pdf>.

- Set "Number of Rings" option to 1. If you happen to experience caller ID issue, you may set it to 2. In the sample setup, it's set to 2.
- Set "PSTN Ring Thru FXS" to "No".

- Set "PSTN Ring Thru Delay" option to 1. If you happen to experience caller ID issue, you may set it to 2. In the sample setup, it's set to 2.
- Set the "Wait for Dial-Tone" to "No".
- Set the "Stage Method (1/2)" to 1.

Wait for Dial-Tone: <input checked="" type="radio"/> No <input type="radio"/> Yes (Default Yes - dial upon dial-tone) Stage Method (1/2): <input type="text" value="1"/> (Default 2 - 2 stage dialing)
---

Figure 17: Configure FXO Port on the HT503 - Channel Dialing

## Exchange SIP Port Settings for FXS and FXO on HT503

- On the HT503 web GUI, go to FXO setting page, configure the "Local SIP Port" to be 5060. (The default setting is 5062.)
- On the HT503 web GUI, go to FXS setting page, configure the "Local SIP Port" to be 5062. (The default setting is 5060.)

## Configure Unconditional Call Forward on HT503

On the HT503 web GUI, go to Basic setting page, configure "Unconditional Call Forward to VOIP" to the DID number **20000**. This is the same number configured in UCM6XXX inbound route dial pattern. In this example, the UCM6XXX IP address is 192.168.5.250.

	User ID	Sip Server	Sip Destination Port
Unconditional Call Forward to VOIP:	<input type="text" value="20000"/>	@ <input type="text" value="192.168.5.250"/>	: <input type="text" value="5060"/>

Figure 18: HT503 Basic Settings

## How to Dial

Once the HT503 and the UCM6XXX are set up as above, the inbound call and the outbound call will be working as described below.

- **Outbound call**  
The extension registered to the UCM6XXX can dial prefix + PSTN number to reach outside numbers in PSTN network, as defined in UCM6XXX outbound route.
- **Inbound call**  
The user from outside network can dial into the PSTN line's number (connected to HT503). And then he/she will reach the IVR of the UCM6XXX. The IVR on UCM6XXX would allow the user to further enter extension number or key pressing digit to reach the desired destination. The inbound call will go through the inbound route set up on the UCM6XXX.
